# Registration page: Scenario and Script

1./ Get data of registration page from the user's browser.
2./ check the chosen login name against the Lookup Database to ensure that it is not already taken.
3./ If login name is already used, then send user back to registration page and request a new login. Otherwise, create an ExWLD ID.
4./ Update both database pages
5./ Create HTML page to confirm registration and to issue the ID.

**Extra:**
Use locks to prevent more than one user to access the database at the same time during registration.
